

## Home Connections – Grade 1

### Kernel Count!

Place a small handful of popcorn kernels (or any small objects) on the table between you and your child. There should be fewer than 100 kernels.

Both players roll a number cube (die). The player who rolls the higher number counts out 5 kernels and slides the group of 5 kernels to his/her side of the table. If both players roll the same number, they both roll the number cube (die) again to break the tie.

The players continue to roll the number cube (die), and each time, the player with the higher number takes a group of 5 kernels.

Keep the groups of kernels separate so that they can be counted by 5's later.

When no more groups of kernels can be made, the players count by 5's to see which player has collected more kernels.
